

### Oracle Application Upgrade and Migration Methodology

Your E-Business Suite, PeopleSoft, JD Edwards, and other applications are some of your organization's most valuable assets. Outages and errors are not an option. Lose them and you might as well lock the doors and send everybody home.

When we shift our focus from infrastructure and software to the critical impact these systems have on our ability to not just "stay in business" but to "grow our business" we focus on TCO and risk reduction. TCO because these systems are expensive. Risk reduction because errors, omissions, outages, have impacts that ripple across the entire enterprise.

If your organization depends on one or more applications hosted on an Oracle Database such as E-Business Suite, PeopleSoft, SAP, Siebel, or Banner you likely already have a closet full of horror stories about hot shot "experts" that took the system offline for an extended period of time, didn't run an end-to-end Proof-of-Concept before an upgrade, didn't write test scripts that fully vetted the integration of a new report before integrating it.

Zione's focus is on our customer's business and its success and for that reason we staff our team with senior technologists with decades of experience each. Just one example of this, our Oracle Database team has an average of 30.5 years of experience with the youngest member of the team having more than 20. If something can go wrong we've probably already seen it. In fact, we've probably already cleaned up after it.

If one of your key initiatives for this year or next is an upgrade or migration of an existing Oracle Database based application contact Zione to learn more about the assets we have that can be focused on reducing risk and making your project a success.
